## 4.1 Random Variables

A random variable  $X$  takes on real numbers according to some distribution.

There are two types of random variables:

- 1 discrete random variables
  - e.g. coin toss, number of baskets scored out of  $n$  trials
- 2 continuous random variables
  - e.g. financial returns

---

## 4.1 Random Variables

### Random sample

$\{X_1, X_2, \dots, X_n\}$  is called a random sample if

- 1 all draws  $X_i$  are **independent**
- 2 and drawn from the same distribution, i.e. they are **identically distributed**

⇒ the draws are **independently and identically distributed** in short **iid**

---

## 4.2 Cumulative Distribution Functions

Probability distribution function: discrete case

$$f_X(x_i) = P(X = x_i)$$

requirements:

- $0 \leq P(X = x_i) \leq 1$
- $\sum_{x_i} f_X(x_i) = 1$

---

## 4.2 Cumulative Distribution Functions

(Probability) Density function: continuous case

$f_X(x)$  is not a probability as  $P(X = x) = 0$

requirements:

- $P(a \leq X \leq b) = \int_a^b f_X(x) dx \geq 0$

- $\int_{-\infty}^{\infty} f_X(x) dx = 1$

---

## 4.2 Cumulative Distribution Functions

### Definition: Cumulative distribution function

The cumulative distribution function (cdf) of a random variable  $X$  is defined to be the function  $F_X(x) = P(X \leq x)$ , for  $x \in \mathbb{R}$ .

**discrete:**

$$F_X(x_i) = \sum_{X \leq x_i} f_X(x_i) = P(X \leq x_i)$$

**continuous:**

$$F_X(x) = \int_{-\infty}^x f_X(t) dt$$

---

## 4.2 Cumulative Distribution Functions

### Properties

- 1)  $F_X(+\infty) = 1; F_X(-\infty) = 0$
- 2)  $F_X(x)$  is a nondecreasing function of  $x$ :  
if  $x_1 < x_2$ ,  $F_X(x_1) \leq F_X(x_2)$   
note: the event  $\{X \leq x_1\}$  is a subset of  $\{X \leq x_2\}$
- 3) if  $F_X(x_0) = 0$ , then  $F_X(x) = 0 \quad \forall \quad x \leq x_0$

---

## 4.2 Cumulative Distribution Functions

### Properties

- 4)  $P(X > x) = 1 - F_X(x)$   
events  $\{X \leq x\}$  and  $\{X > x\}$  are mutually exclusive and  
 $\{X \leq x\} \cup \{X > x\} = \Omega$
- 5)  $F_X(x)$  is continuous from the right:  
 $\lim_{x \rightarrow a^+} F_X(x) = F_X(a)$
- 6)  $P(x_1 \leq X \leq x_2) = F_X(x_2) - F_X(x_1)$

---

## 4.3 Expectation, Variance and Moments

Expectations of a random variable

$$E[X] = \begin{cases} \sum_{x_i} x_i f_X(x_i) & \text{if } x \text{ is discrete} \\ \int_{-\infty}^{\infty} x f_X(x) dx & \text{if } x \text{ is continuous} \end{cases}$$

If  $g(X)$  a measurable function of  $x$ , then:

$$E[g(X)] = \begin{cases} \sum_{x_i} g(x_i) f_X(x_i) & \text{if } x \text{ is discrete} \\ \int_{-\infty}^{\infty} g(x) f_X(x) dx & \text{if } x \text{ is continuous} \end{cases}$$

---

## 4.3 Expectation, Variance and Moments

### Calculation rules

- $E[a] = a$
- $E[bX] = b \cdot E[X]$
- linear transformation:  $E[a + bX] = a + bE[X]$
- $E[g_1(X) + g_2(X)] = E[g_1(X)] + E[g_2(X)]$

---

## 4.3 Expectation, Variance and Moments

### Variance of a random variable

Let  $g(X) = (X - E[X])^2$

$$\begin{aligned} \text{Var}[X] &= \sigma^2 = E[(X - E[X])^2] \\ &= \begin{cases} \sum (x_i - E[X])^2 f_X(x_i) & \text{if } x \text{ is discrete} \\ \int_{-\infty}^{\infty} (x - E[X])^2 f_X(x) dx & \text{if } x \text{ is continuous} \end{cases} \end{aligned}$$

---

## 4.3 Expectation, Variance and Moments

### Calculation rules

- $Var[a] = 0$
- $Var[X + a] = Var[X]$
- $Var[bX] = b^2 Var[X]$
- $Var[a + bX] = b^2 Var[X]$

**important result:**

$$Var[X] = E[X^2] - E[X]^2$$

---

## 4.3 Expectation, Variance and Moments

Standardization of a random variable  $X$

Let

$$g(X) = \frac{X - \mu}{\sigma} = Z$$

$$Z = \frac{X - \mu}{\sigma} = \frac{-\mu}{\sigma} + \frac{1}{\sigma}X$$

$$\Rightarrow E[Z] = 0 \quad \text{and} \quad Var[Z] = 1$$

---

## 4.3 Expectation, Variance and Moments

### Chebychev Inequality

For any random variable  $X$  with finite expected value  $\mu$  and finite variance  $\sigma^2 > 0$  and a positive constant  $k$

$$P(\mu - k\sigma \leq X \leq \mu + k\sigma) \geq 1 - \frac{1}{k^2}$$

---

## 4.3 Expectation, Variance and Moments

### Skewness and Kurtosis

Central moments of a random variable:

$$\mu_r = E[(X - \mu)^r]$$

as  $r$  grows,  $\mu_r$  tends to explode

Solution: normalization

- skewness coefficient:  $\gamma = \frac{E[(X - \mu)^3]}{\sigma^3}$
- kurtosis:  $\kappa = \frac{E[(X - \mu)^4]}{\sigma^4}$   
often reported as excess kurtosis  $\kappa - 3$

---

## 4.4 Quantile

### Quantile

$q\%$  of the probability mass of a random variable is left of  $x(q)$  .

Example: Risk measure Value-at-risk (VaR)

$$q = P(X \leq x(q)) = F(x(q))$$

---

## 4.5 Specific probability distributions

### The normal distribution

$X$  is a Gaussian or normal random variable with parameters  $\mu$  and  $\sigma^2$  if its density function is given by

$$f_X(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right)$$

denoted  $X \sim N(\mu, \sigma^2)$

**Linear transformation is also normally distributed:**

If  $X \sim N(\mu, \sigma^2)$ , then  $a + bX \sim N(a + b\mu, b^2\sigma^2)$ .

---

## 4.5 Specific probability distributions

Standardization of  $X$  leads to standard normal distribution:

$$a = -\frac{\mu}{\sigma} \quad , \quad b = \frac{1}{\sigma}$$

$$z = \frac{x - \mu}{\sigma} \sim N(0, 1)$$

$$\Phi(z) = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{z^2}{2}\right)$$

Thus, if  $X \sim N(\mu, \sigma)$ , then  $f(x) = \frac{1}{\sigma} \Phi\left(\frac{x-\mu}{\sigma}\right)$ .

---

## 4.5 Specific probability distributions

The  $\chi^2$  distribution:

$X$  is said to be  $\chi^2(n)$  with  $n$  degrees of freedom if

$$f_X(x) = \begin{cases} \frac{x^{\frac{n}{2}-1} e^{-\frac{x}{2}}}{2^{\frac{n}{2}} \Gamma(\frac{n}{2})} & x \geq 0 \\ 0 & \text{otherwise} \end{cases}$$

If  $z \sim N(0, 1)$ , then  $x = z^2 \sim \chi^2(1)$ .

If  $z_i$  are iid  $N(0, 1)$ , then  $\sum_{i=1}^n z_i^2 \sim \chi^2(n)$ .
