

Contents

0. Preliminaries

- Gentzen-style natural deduction
- Philosophical preliminaries

I. E rules as syntactical functions of I rules

- Generalized rules for logical constants
- The adequacy of generalized rules
- Case study: Negative circularity
- Natural deduction with atomic rules

II. Proof-theoretic validity

- Proofs, rules and consequence
- The origin of proof-theoretic validity: computability
- Prawitz's definition of validity
- Validity based on E rules
- General proof structures and justifications
- The trivialization problem

III. Local inversion and reflection

- Critique of globalization
- The model of the sequent calculus
- Systems based on atomic clauses (inductive definitions)
- Adequacy
- Variants of definitional reflection
- Beyond definitional reflection
- Partial and global meaning
- Conclusion
