

Oberseminar
Geometrische Analysis, Differentialgeometrie und Relativitätstheorie

Am Donnerstag, den **20.04.2023** spricht um **14:15 Uhr** im Raum **S9 (C06H05)** und über Zoom

Anna Sancassani
(Tübingen)

über das Thema

Corresponding CMC initial data sets and their KIDs

A result by Choquet-Bruhat and Geroch allows us to study the Einstein Equation as a Cauchy problem, describing the evolution of suitably defined initial data. As observed by Chruściel and Tod, there exists a simple algebraic transformation mapping initial data with constant mean curvature (CMC) and $\Lambda < 0$ to CMC initial data with $\Lambda = 0$. This correspondence in particular links the hyperbolic slice in Anti-de Sitter (AdS) to the hyperboloidal slice in Minkowski, and it has been used to heuristically transfer knowledge between asymptotically flat and asymptotically AdS Spacetimes. In this talk, I will present results on the effect of this correspondence on the symmetries of two spacetimes originated by a pair of such initial data sets. This is done in vacuum by studying the Killing initial data (KIDs) of two corresponding CMC initial data sets.
